INTEGRATION OF FIRE/SMOKE PROTECTION EQUIPMENT INTO BUILDING MANAGEMENT SYSTEMS

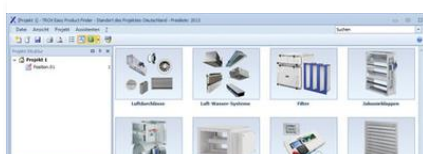

Due to the use of modern, decentralised, and open communication systems, fire protection system solutions can be realised cost-effectively with minimum wiring expenses and direct integration into centralised building control systems. All information can be called from a central point and corresponding follow-up regulations can proceed automatically in case of a fire. Today, bus systems offer comprehensive system solutions for fire protection equipment so that fires can be detected and limited early on.
